## ALIGNMENTS

Disclosure; Fig 1; 24pp; English.

Interacts with Epstein-Barr virus (EBV) early lytic cycle BHRF1

protein, and is capable of modulating apoptosis. The protein may

be used in complete or partial form, or as an epitope tag fusion

protein, in a new virucide drug screening method, which involves

combination of Bak protein and a viral protein (e.g. BBV BHRF1),

Exposure to a test compound, and monitoring for disruption of the

interaction, e.g. by co-precipitation, protein interactive trapping

or ELISA. Interaction of Bak and viral proteins allows viral

replication or latency in the absence of apoptosis. Compounds which

inhibit the interaction may be used as virucide, antitumour or

diagnostic agents. Compounds which Human; Bak; apoptosis; latency; virus replication; Epstein-Barr virus; BHRF1; fusion protein; epitope tag; drug screening; co-precipitation; ELISA; immunoassay; antibody; protein interactive trapping; virucide; antitumour; diagnostic. Claim 3: Fig 4: 100pp; English.

Bel-Y protein (R81451) is a member of the Bel-2 family and can had easy a protein (R81451) is a member of the Bel-2 family and can induce apoptosis in celis and function as a negative regulator of Bel-2 function. Bel-Y mRNA was detected in all human tumour cell inses examined and is also widely expressed in primary human tissues. It can be obte, by expression of a full-length CDNA clone (T1775) in pref. mammalian host cells. Bel-Y can be used to develop profes. For treating disorders associated with inappropriate cell proliferation or cell death, and to raise antibodies used for the diagnosis or monitoring of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0; Gaps

Cdn-1 cDNA was isolated from a human heart cDNA library using a previously isolated clone as probe. Recombinant Cdn-1 was produced in Sf9 and human colon adenocarcinoma HT29 cells. Expression of Cdn-1 in WI-12 lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

be used in complete or partial form, or as an epitope tag fusion protein, in a new virucide drug screening method, which involves combination of Bak-2 protein and a viral protein (e.g. EBV BRRPI), exposure to a test compound, and monitoring for disruption of the interaction, e.g. by co-precipitation, protein interactive trapping or ELISA. Interaction of Bak-2 and viral proteins allows viral replication or latency in the absence of apoptosis. Compounds which inhibit the interaction may be used as virucide, antitumour or

Cdn-2 cDNA was isold. from a human placental genomic library using a 950 bp fragment of Cdn-1 cDNA. Expression of Cdn-2 in mouse progenitor B-cell FL5.12 cells decreased IL-3-induced apoptosis. The Cdn-2 protein displayed 97% amino acid identity with Cdn-1 (R77876).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Fig.11; 66pp; English.

Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis. Deletion of the N-terminal 59 amino acids of Cdn-1 only slightly decreased this activity, suggesting that small, truncated Cdn-1 sequence 152 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 mvtlplqpsstmgqvgrqlai1gddinrrydsefqtmlqhlqptaenayeyftkiatslf

                                                              Disclosure; Fig.11; 66pp; English.

Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in increased cell survival in response to anti-Fas-mediated apoptosis. Deletion of the N-terminal 70 amino acids of Cdn-1 improved this activity, suggesting that small, truncated Cdn-1 molecules may be potent therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Fig.11; 66pp; English.

Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in Expression of Cdn-1 in WI-L2 lymphoblastoid cells resulted in Tarcassed cell survival in response to anti-Fas-mediated apoptosis. Truncated Cdn-1 derivatives given in R77879-81 were used to test the effects of deleting the N-terminal sequences of Cdn-1 on this activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 rfvvdfmlhhciarwiaqrggwvaalnlgngpilnvlvvlgvvllgqfvvrrffks 116

New poly-nucleotide encoding new poly-peptide(s) that modify apoptosis - and related vectors, recombinant cells and antibodies, useful in assay and for control of cell death in e.g. neuronal cells, lymphocytes and cancers.

Claim 4: Page 87: 127pp: English.

This protein may be expressed recombinantly, particularly with pcmV plasmids as vectors for expression in mammalian cell cultures.

The protein has particular application in cancer cells (failure of programmed cell death (PCD)) or neurodegenerative and autoimmune diseases (premature PCD), e.g. Parkinson's disease, amylotrophic lateral 7 60 vvngatvhrsslevheivrasdvrgalrdagdefelryrrafsdltsglhitpgtaygsf 119 120 eqvvnelfhdgvnwgrivaffsfggalcvesvdkemrvlvgrivswmttyltdh-ldpwi 178 52 VAAPADPEMVTLPLQPSSTMGQVGRQLAIIGDDINRRYDSEFQTMLQHLQPTAENAYEYF 111 Gaps Chicken lymphoid BCL-X.

Nucleic acids encoding apoptosis regulating proteins - useful for diagnosing and treating immune disorders, malignancies, etc.
Example 8; Pages 34-35; 60pp; English.
The 80-6 mutant (W01020) of the bcl-2 oncogene product (W01018) lacks amino acids 80-86 of the native protein. This and other Bcl-2 mutants (see also W01019-21) were used in a two hybrid assay to examine the interactions between Bcl-2 and novel apoptosis-regulating proteins Nipl, Nip2 and Nip3 (W00997-99). 2 Motifs (W01003-04) on Bcl-2 were identified that are essential for interaction with the Nip proteins. These motifs show homology W01020 standard; Protein; 232 AA.
W01020.
18-DEC-1996 (first entry)
Apoptosis-blocking protein Bcl-2 mutant 80-6 (del80-86).

                                                                                                                                                                                                                               New poly-nucleotide encoding new poly-peptide(s) that modify apoptosis - and related vectors, recombinant cells and antibodies, useful in assay and for control of cell death in e.g. claim 3; page 94; 127pp; English.

This protein may be expressed recombinantly, particularly with pcmV plasmids as vectors for expression in mammalian cells cultures. The protein has particular application in cancer cells (failure of programmed cell death (PCD)) or neurodegenerative and autoimmune diseases (premature PCD), e.g. Parkinson's disease, amylotrophic sequence 233 AA;

                       diagnosing and treating improcase registrating functions.

Example 8; Page 33-34; 60pp; English.

The 42-8 mutant (W01019) of the bcl-2 oncogene product (W01018)
lacks amino acids 42-48 of the native protein. This and other
Bcl-2 mutants (see also W01020-21) were used in a two hybrid assay
to examine the interactions between Bcl-2 and novel apoptosis-
regulating proteins Wipl, Wip2 and Nip3 (W00997-99). The Nip
proteins were unable to interact with mutant 42-8. The site of
deletion in this mutant corresponds to a motif (see also W01003)
on Bcl-2 essential for interaction with Nip proteins. A second
binding motif (W01004) of Bcl-2 was also identified, and both
sequence 232 AA;

With year of the producing and identifying mutant bcl-2 proteins -
Wethods for producing and identifying mutant bcl-2 proteins -
Heat lack death repressor activity and/or lacks binding to Bax.

By Disclosure; page 40; 133pp; English.

The sequences given in R71404-05 represent the human bcl-2 alpha and
beta proteins respectively. bcl-2 is encoded by a proto-oncogene and
compared by a proto-oncogene and beta proteins respectively. bcl-2 is encoded by a proto-oncogene and
compared by a proto-oncogene and is capable of inhibiting apoptosis in many hematopoietic cell systems.

Collosing rather than directly promoting proliferation of these cell
corgins rather than directly promoting proliferation of these cell
corgins rather than directly promoting proliferation of these cell
corgins rather than directly promoting proliferation of these cell
corgins rather than directly promoting proliferation of these cell
corgins rather than directly promoting proliferation of these cell
corgins rather than directly promoting proliferation of cell
corgins rather than directly promoting and compared cell
corgins rather than directly promoting and consentrations of IL-3. bcl-2 has not been shown to directly promote cell corginal and it
concentrations of IL-3. bcl-2 has bax accelerates apoptotic cell death
collowing an apoptotic stimulus. The invention gives mutant form of
collowing an apoptotic stimulus. The invention gives mutant form
collowing an apoptotic stimulus. This makes the mutant protein substantially
controlling in the BHI or BH2 domains. This makes the mutant protein substantially
controlling in the BH1 or BH2 domains. This makes the mutant protein substantially
controlling an apoptotic cell death represent and diagnosis of immunodeficiency diseases, including AHDS and
controlling and diagnosis of immunodeficiency diseases, including AHDS and
controlling representative and ischaemic cell death.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Tilly, J.L.; Tilly, K.I.; Kenton, M.L.; Johnson, A.L. Endocrinology (1995) 136:232-241

Expression of members of the bcl-2 gene family in the immature rat ovary: equine chorionic gonadotropin-mediated inhibition of granulosa cell apoptosis is associated with decreased bax and constitutive bcl-2 and bcl-xlong messenger ribonucleic acid levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

C -1- FUNCTION: PROLONGS THE SURVIVAL OF HEMATOPOIETIC CELLS IN THE ABSENCE OF REQUIRED GROWTH FACTORS AND ALSO IN THE PRESENCE OF VARIOUS STIMULI INDUCING CELLULAR DEATH. BLOCKS APOPTOSIS. MIGHT FUNCTION IN AN ANTIOXIDANT PATHWAY TO PREVENT APOPTOSIS. MIGHT FUNCTION IN AN ANTIOXIDAN SUCH AS MITOCHONDRIA.

C -1- SUBCELLULAR LOCATION: MITOCHONDRIAL INNER MEMBRANE.
C -1- TISSUE SPECIFICITY: EXPRESSED IN A VARIETY OF TISSUES.
II CHRONIC LYMPHATIC LEUKEMIAN BY A CHROMSOMAL TRANSLOCATION
C -1- DISEASE: INVOLVED IN WOLLICH INVOLVES BCLZ AND IMMUNOGLOBULIN GENE

NUCLEIC ACIDS RES. 20:4187-4192(1992).

- 1- FUNCTION: PROLONGS THE SURVIVAL OF HEMATOPOIETIC CELLS IN THE ABSENCE OF REQUIRED GROWTH FACTORS AND ALSO IN THE PRESENCE OF STRUCTION STRUCTION TO ARRIOUS STIMULI INDUCING CELLULAR DEATH. BLOCKS APOPTOSIS. MIGHT FUNCTION IN AN ANTIOXIDARY TO PREVENT APOPTOSIS AT SITES COP FREE RADICAL GENERATION SUCH AS MITOCHONDRIA.

- 1- SUBCELLULAR LOCATION: MITOCHONDRIA.

- 1- TISSUE SPECIFICITY: EXPRESSED IN A VARIETY OF ITSSUES.

- 1- ALTERNATIVE PRODUCTS: TWO FORMS OF BCL-2: ALPHA, AND BETA, ARE PRODUCED BY ALTERNATIVE SPICING OF THE SAME GENE. THEY ONLY

- ISMILARITY: BELONGS TO THE BCL-2: FAMILY.

- SIMILARITY: BELONGS TO THE BCL-2 FAMILY.

- SIMILARITY: BLOONGS TO THE BCL-3 FAMILY.

protein.

Disclosure: Fig 1, 24pp; English.

The sequence encodes Bak protein, which is a bcl-1 homologue which interacts with Epstein-Barr virus (EBV) early lytic cycle BHRF1

The rotein, and is capable of modulating apoptosis. The Bak gene is located on human chromosome-6 at 6p21-23. The protein may be used in complete or partial form, or as an epitope tag fusion protein, or an anew virucide drug screening method, which involves combination of Bak protein and a viral protein (e.g. BEV BHRRI), exposure to a test compound, and monitoring for disruption of the interaction, c.g. by co-precipitation, protein interactive trapping or ELISA.

Interaction of Bak and viral protein earlows viral replication or interaction of Bak and viral protein allows viral replication or latency in the absence of apoptosis. Compounds which inhibit the interaction may be used as virucide, antitumour or diagnostic agents.

Now nucleic acid sequences encoding Cdn apoptosis modulators - and related vectors, transformed cells, proteins and antibodies, useful or diagnosis and treatment e.g. of HIV infection, reperfusion injury
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 4; Fig.3A-C; 66pp; English.
Gdn-1 cDNA was isolated from a human heart cDNA library using a
proviously isolated clone as probe. Recombinant Cdn-1 was produced
in Sf9 and human colon adenocarcinoma HT29 cells. Expression of

Claim 6; Fig 4; 100pp; English.
A full-length cDNA clone (T17375) codes for Bcl-Y (R81451), a
protein that induces apoptosis in cells and functions as a negative
regulator of Bcl-2 function. It was isolated from a Jurkat cell
cDNA library using as probe a partial Bcl-Y cDNA clone obtd. by
PCR of DNA derived from the Namalwa cell line. The cDNA can be used
for prodn. of recombinant Bcl-Y, as a probe, to produce transgenic
animal models, and in the gene therapy of disorders characterised by
inappropriate cell proliferation or cell death.

The sequence was derived from the DNA encoding natriuretic peptide receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors for the prodein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr-114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cnrgsnndnnnndsnnndwmnrysnnndnvkgmannhnsnnsshgsnkssncvvdsrnvn
